

Creative tip Leaf metal „plate“

Step 1

Using a flat brush, apply a thin, even layer of size to the surface. Leave to dry for 15 - 20 min. Clean the brush in water. Place the leaf metal on the still slightly sticky size.

Step 2

That's easier to do if you transfer the individual sheets of leaf metal onto a piece of cardboard when you take them out of the pack.

Step 3

In the case of larger surfaces, arrange the sheets so that they overlap slightly. After you have covered the entire surface, gently tamp the leaf metal down using a soft brush or cloth.

Step 4

With a round brush, work the leaf metal into the surface using circular motions.

Step 5

After leaving to dry for approx. 24 hours, apply a protective coat of shellac or FIMO varnish.
